

Data Model & Tools ^[1]

Salesforce is at the heart of eComm, but it would be nothing without other systems across CU. Most of eComm's Salesforce Contacts are from a source system (updated nightly) and enhanced with engagement information from eComm's other applications (Marketing Cloud & Cvent), constituents and eComm specialists.

Campus Solution

Academic & Enroll

eComm's constituents are comprised of data from multiple systems (listed below). **CU People (CUP)** - formerly Master Data Management (MDM) - aggregates these details on one record and then passes it to Salesforce for use.

- **Advance** | Donors, Friends & Alumni Updates
- **Campus Solutions** | Academic & Enrollment Details
- **Human Capital Management (HCM)** | CU Employment Details
- **Identity Management (IDM)** | Campus-level Affiliations
- **eComm Specialist** | Contacts that do not exist in one of the above data systems can be created directly in Salesforce by an eComm specialist

Once a contact is created in Salesforce, there are a few ways the contact's information gets updated and enhanced:

- **Marketing Cloud** | Enhances a Contact by layering on individual email preferences and Individual Email Results (IERs).
 - Marketing Cloud and Salesforce have a bi-directional integration meaning a Marketing Cloud email can be distributed to a targeted audience created in Salesforce and data from that email is sent back to Salesforce.
- **Cvent** | Enhances a Contact by adding event participation (and creates new Contacts when necessary).
- **Form Assembly** | Enhances a Contact by including any action taken to subscribe (and creates new Contacts when necessary).
- **eComm Specialists** | Update a constituent's Email Preferences
 - Constituents can adjust their Email Preferences by receiving an email and selecting '*Manage My Preferences*' in the footer
- **Advance, Campus Solutions & HCM** | Updates constituent's First Name, Last Name, or Email (depending on which source system the Contact originated from)

Data Dictionary & Entity Relationship Diagram (ERD)

The [data dictionary](#) [2] provides full descriptions and values of fields that exist in Salesforce while the [Entity Relationship Diagram \(ERD\)](#) [3] indicates how the data is related to one another.
